

What PCA captures—and what preprocessing changes

Scree, three-dimensional projection, covariance PCA, and component weights

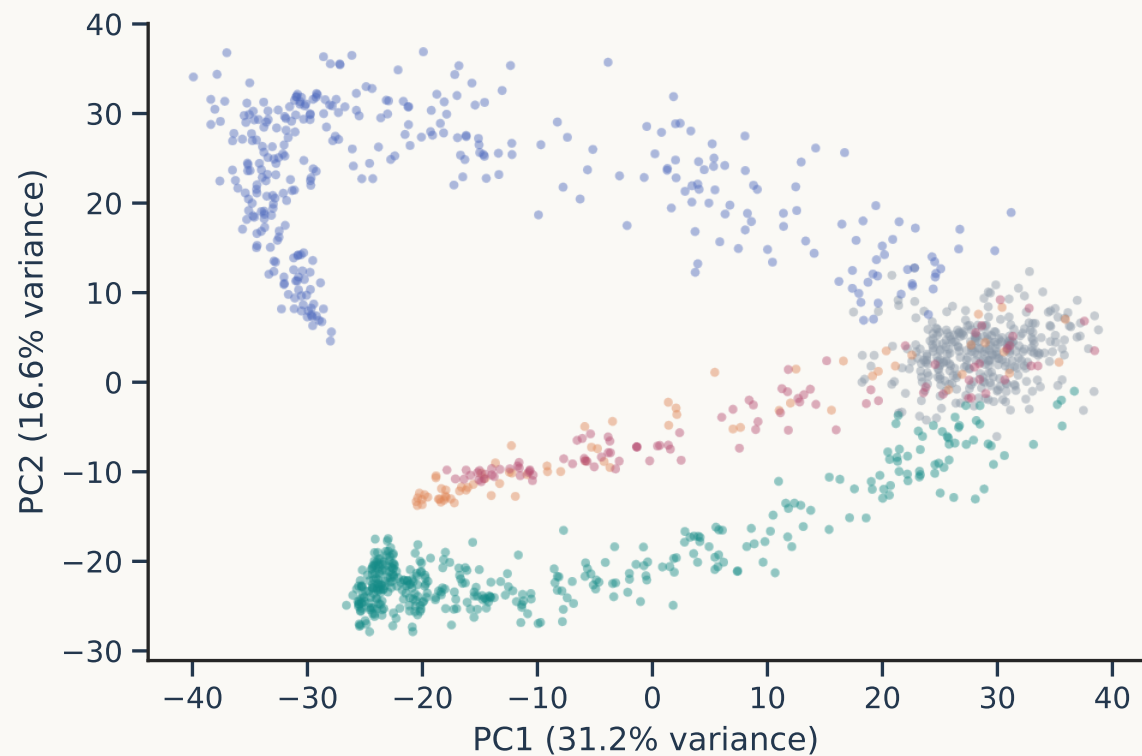

Standardized PCA: explained variance

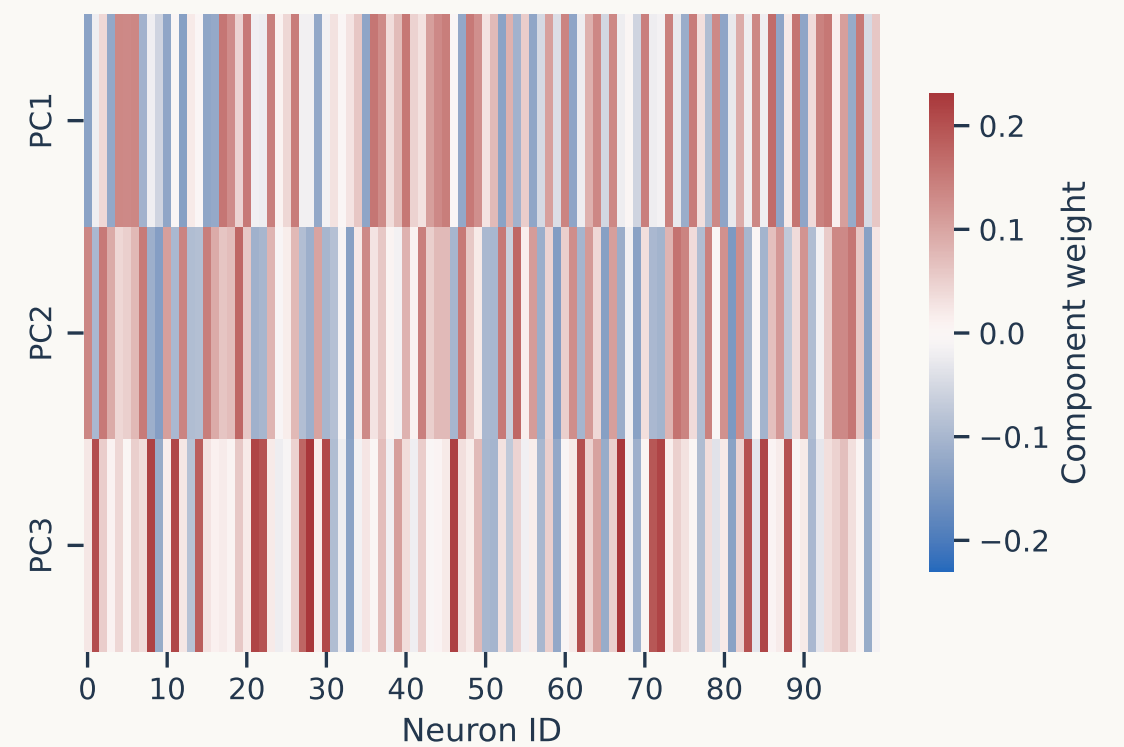

First three PCs: 51.4% of variance

Centered rates without standardization

Standardized PCA: signed neuron weights

Standardization gives each nonconstant neuron unit variance. Centering alone lets high-variance neurons contribute more.
Component signs may flip between implementations. Time bins are temporally related; these plots do not establish four discrete clusters.
